MD: decomposition stiffens the SAW

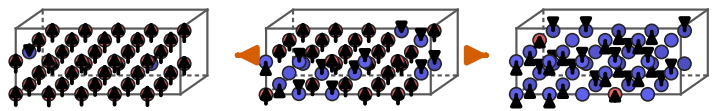

$Fe_{64}Cr_{36}$, MD 25^3 cells: random → $\alpha + \alpha'$

DFT: stiff α' enters the unallowed range

α (5% Cr) | Fe–36Cr | α' (95% Cr)

C' = 56 GPa | C' = 68 GPa | C' **= 145 GPa**

QE cells; arrows: local magnetic moments
